Is pasture rest time or timing?

The purpose of pasture rest is to increase landscape carbon stocks in all forms to increase ‘resilience’ not just grow a bit more feed.

The basis of Carbon Grazing®:

4-6 weeks rest immediately after rain

This is why pasture rest is “timing” not “time”

THE BASIS OF CARBON GRAZING®:
4-6 weeks rest immediately after rain

Outcomes of Resilience

- Less methane per kg of production from ruminants
- Reduced impact of drought
- Increased profits
- Improved water quality
- Reduced impact of climate change
- Remove more CO₂ from the atmosphere
- Increased pasture digestibility
